

MIDDLEMAN

**The missing view in
the Rails API stack**

@bradgessler

CTO & Cofounder of Poll Everywhere

~~Its like~~
~~Jekyll~~

Middleman is
extraordinarily
well documented

The screenshot shows a browser window with the title "Middleman: Hand-crafted frontend development" and the URL "middlemanapp.com". The page features a large logo with the letters "MM" inside a shield shape, with the word "MIDDLEMAN" below it. The background has a sunburst pattern. Below the logo, the text "makes developing websites" is visible. A dark blue button contains the command "\$ gem install middleman". Below that is a search bar with the placeholder text "Search the documentation". At the bottom, there is a line of text: "Middleman is a static site generator using all the shortcuts and tools in modern w". Social media links for GitHub ("Watch") and Twitter ("Follow @middlemanapp") are also present.

Middleman: Hand-crafted frontend development
middlemanapp.com

MM
MIDDLEMAN

makes developing websites

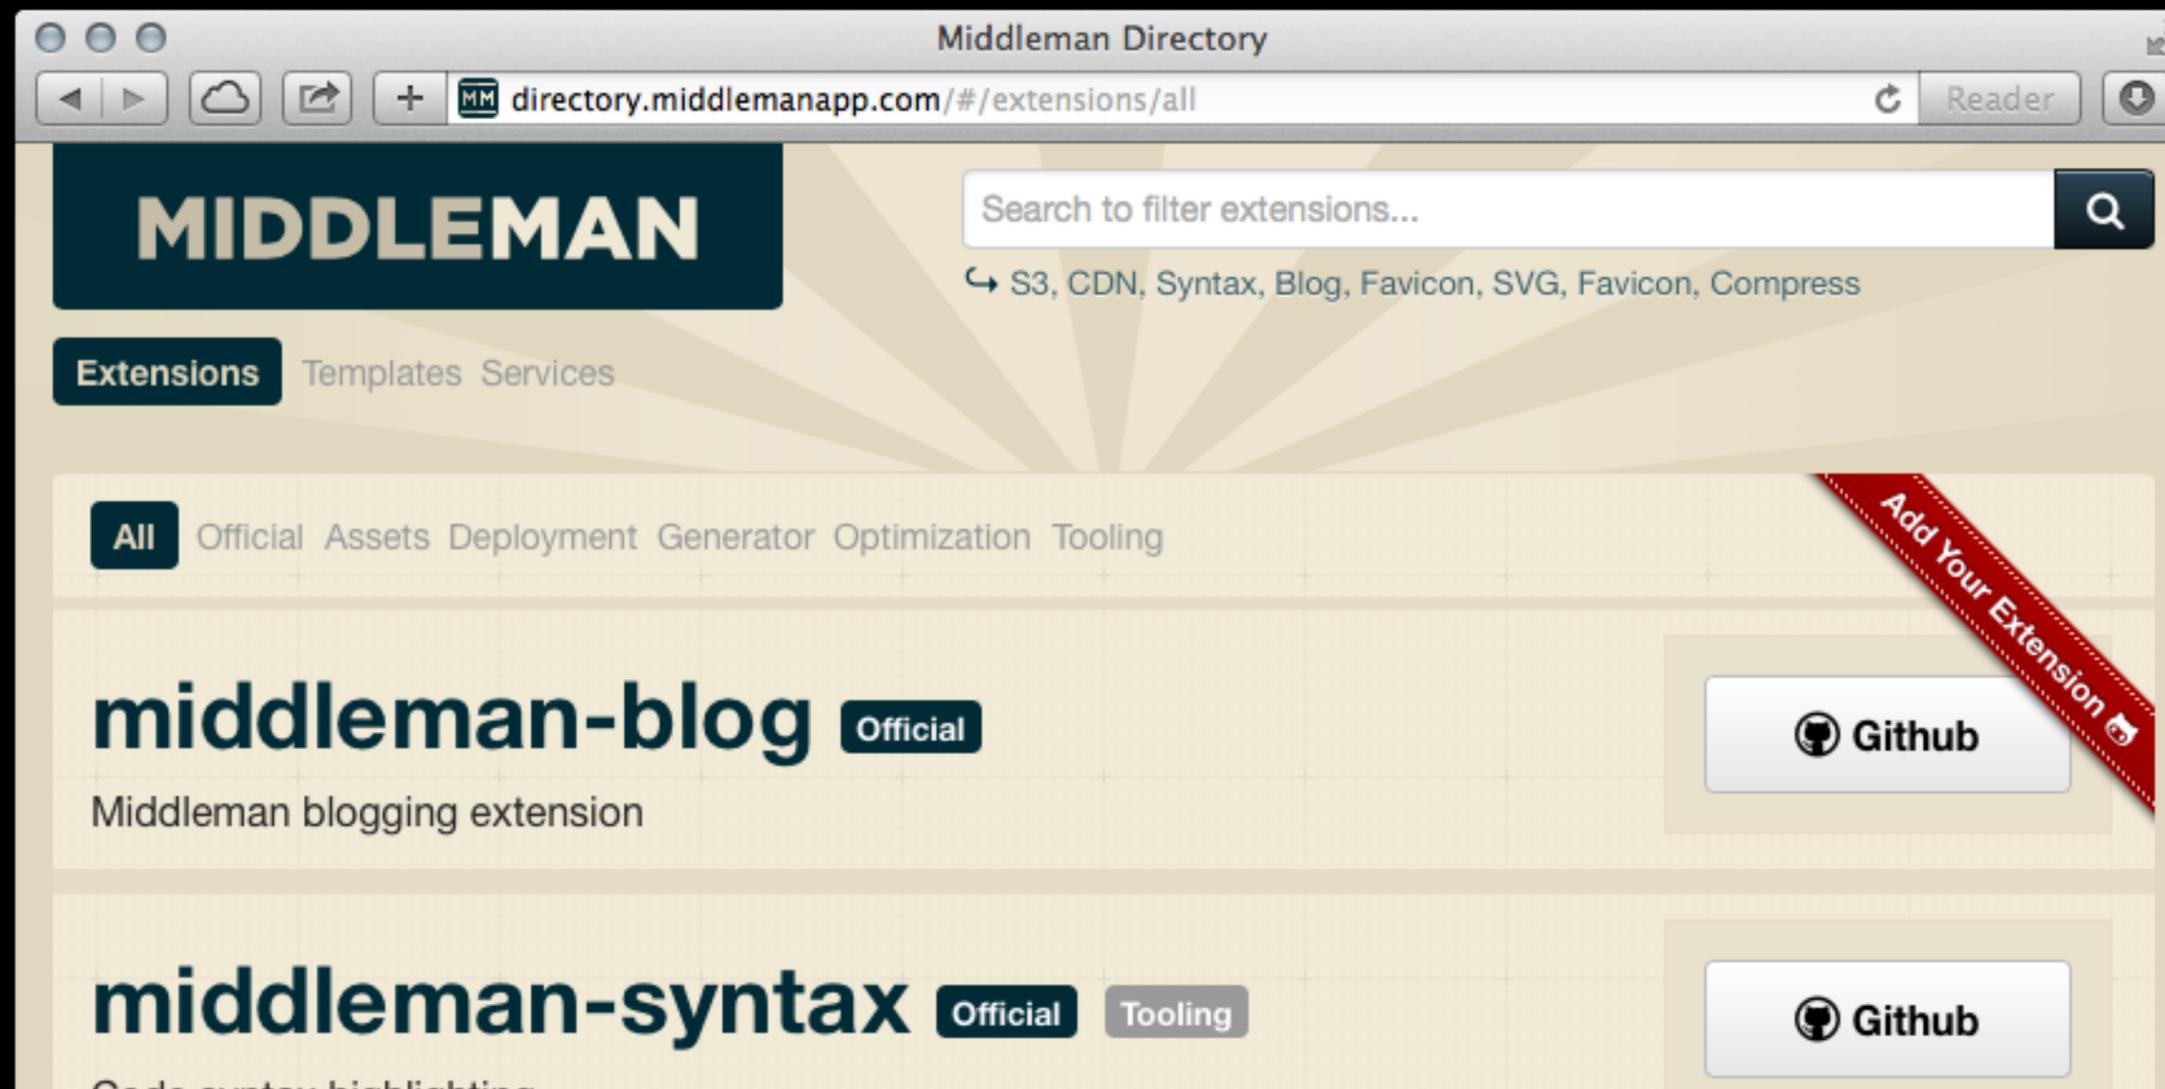

\$ gem install middleman

Search the documentation

Middleman is a static site generator using all the shortcuts and tools in modern w

Watch Follow @middlemanapp

Middleman is **modular** with a **rich ecosystem of extensions**

```
$ gem install middleman
```

```
$ middleman init my-app
```

```
  create my-app/.gitignore
```

```
  create my-app/config.rb
```

```
  create my-app/source/index.html.erb
```

```
  create my-app/source/layouts/layout.erb
```

```
  create my-app/source/stylesheets
```

```
  create my-app/source/javascripts
```

```
$ cd my-app ; middleman server
```

```
== The Middleman is standing watch at http://0.0.0.0:4567
```

Getting Started with Middleman

Has all of the same **front-end goodies**
from Rails, so you'll feel right at home

```
gem 'haml'
```

```
gem 'sass'
```

```
gem 'sprockets'
```

```
gem 'coffee-script'
```

```
gem 'compass'
```

```
gem 'active-support'
```

```
gem 'susy'
```

Middleman is **multi-environment** **aware**

```
# ./config.rb
# Local dev server settings
configure :development do
  activate :livereload
end

# Production settings
configure :build do
  activate :minify_css
  activate :minify_javascript
  activate :asset_hash
end
```

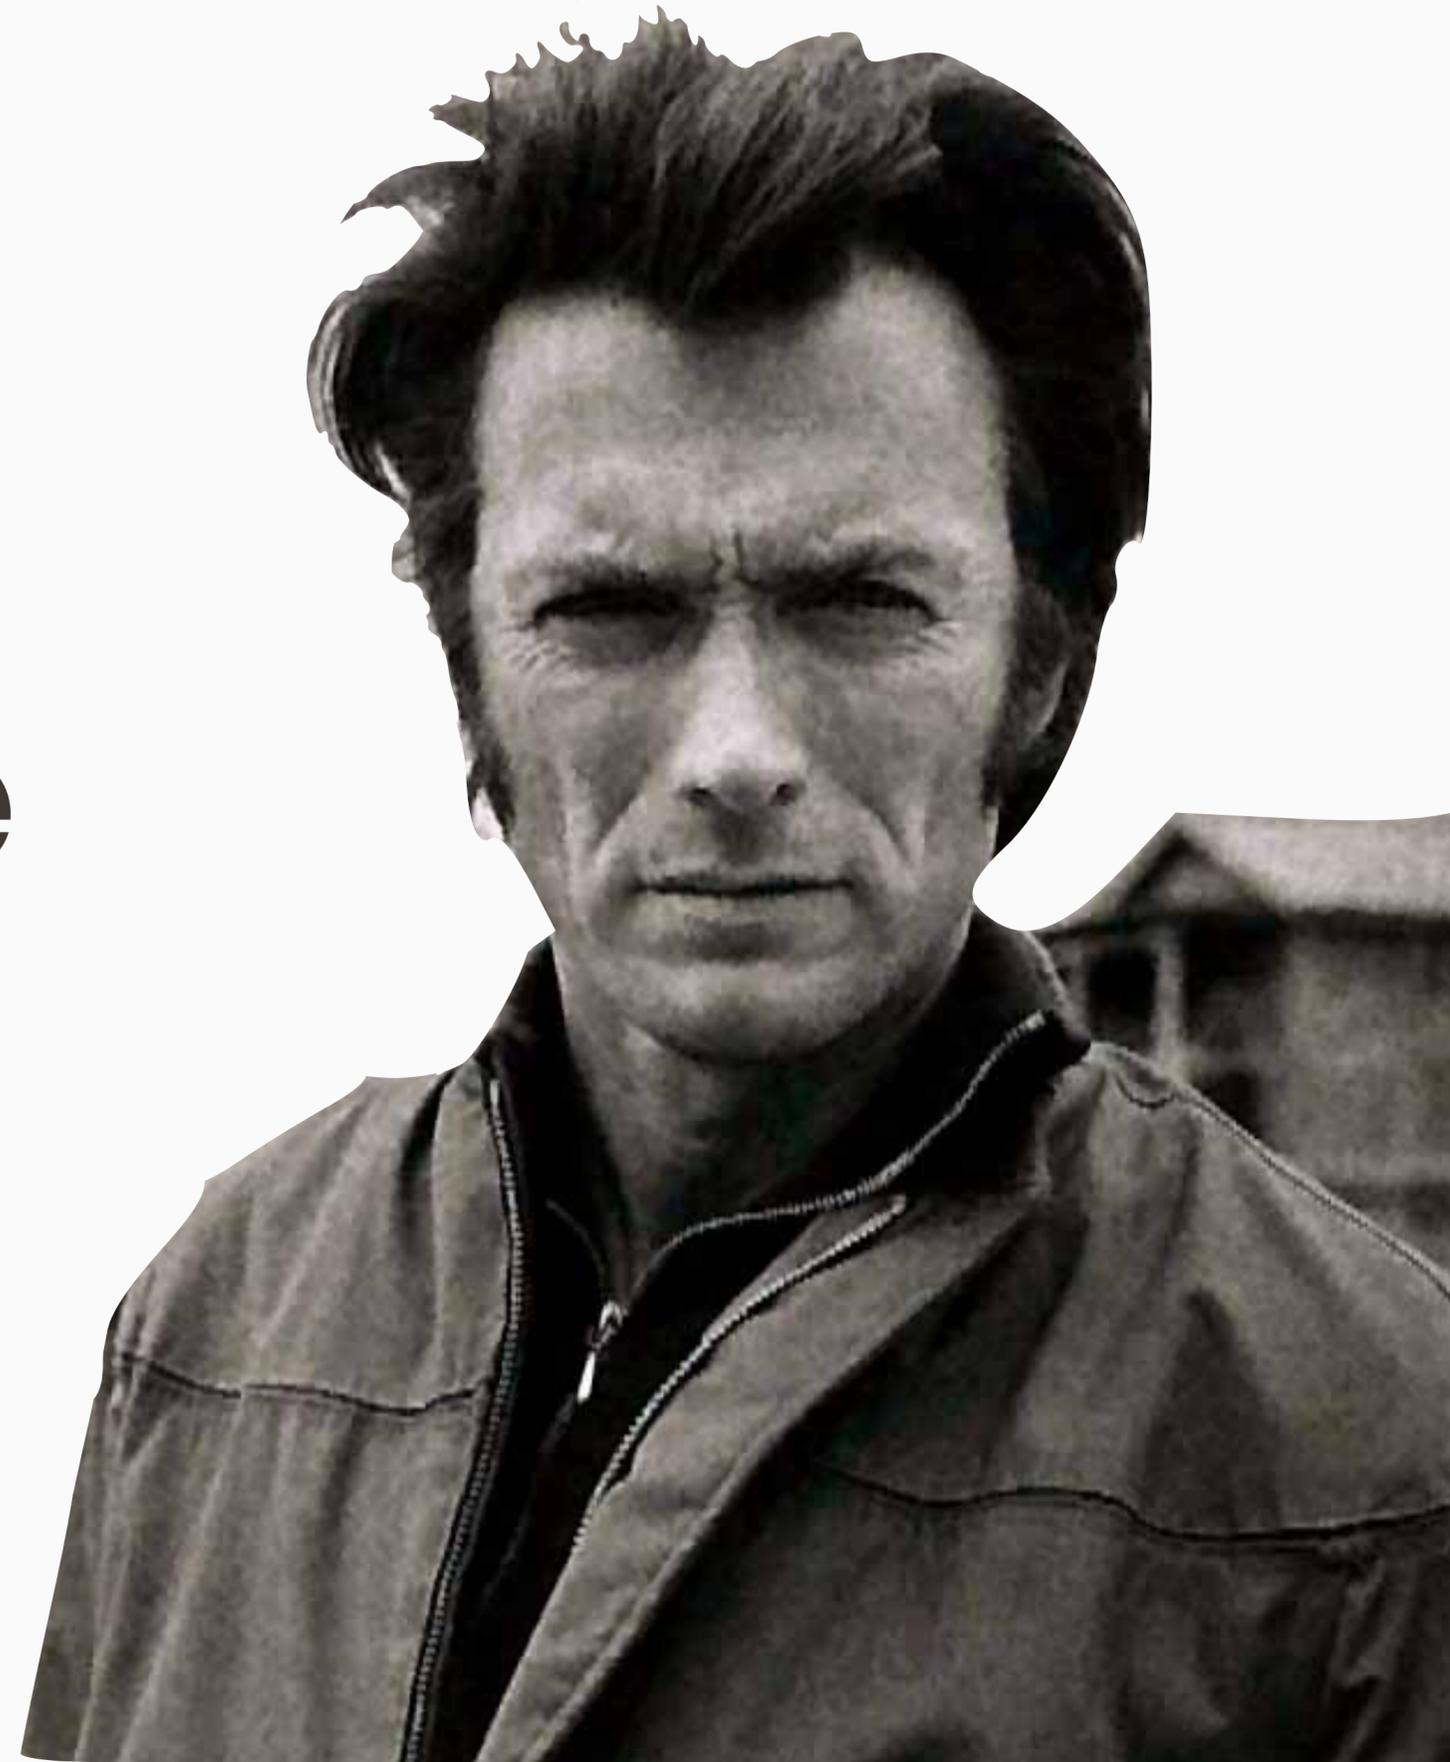

A simple **two step deploy** process

```
task :build do
  sh 'bundle exec middleman build'
end
```

```
task :upload do
  sh 'rsync -avz ./build/ deployer@site.com:/www/'
end
```

```
task deploy: %w[build upload]
```

Yeah, so what?
Why should I care
about Middleman?

Web apps fall somewhere within
a spectrum of dynacism

Dynamic

Realtime visualizations

Poll Ev graphs

Middleman

JS MVC Library

GUI-oriented applications

Google Spreadsheets

Rails

Less caching

Document-oriented web apps

Invoicing application

Bloggng platform

Svbtle, Posthaven

Rails

More caching

Personal blog

bradgessler.com

Informational website

Steve's Plumbin' Services

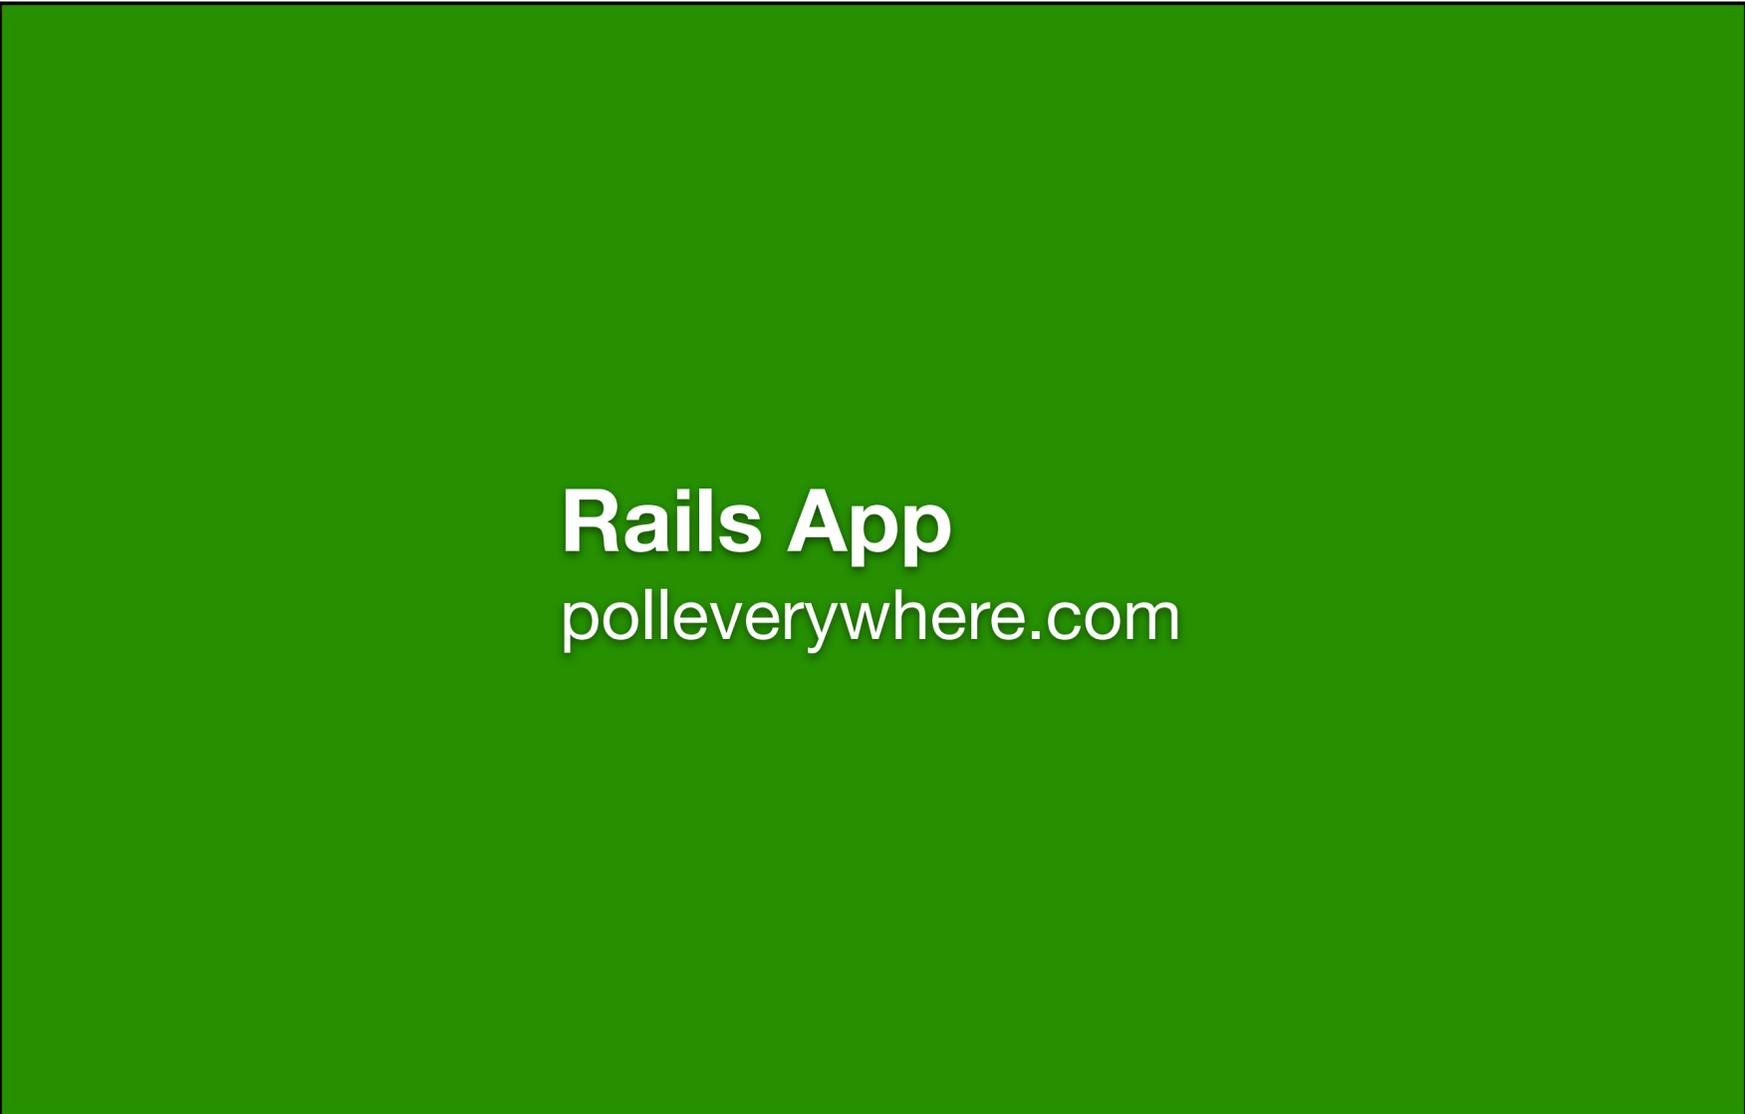

Middleman

HTML content

Static

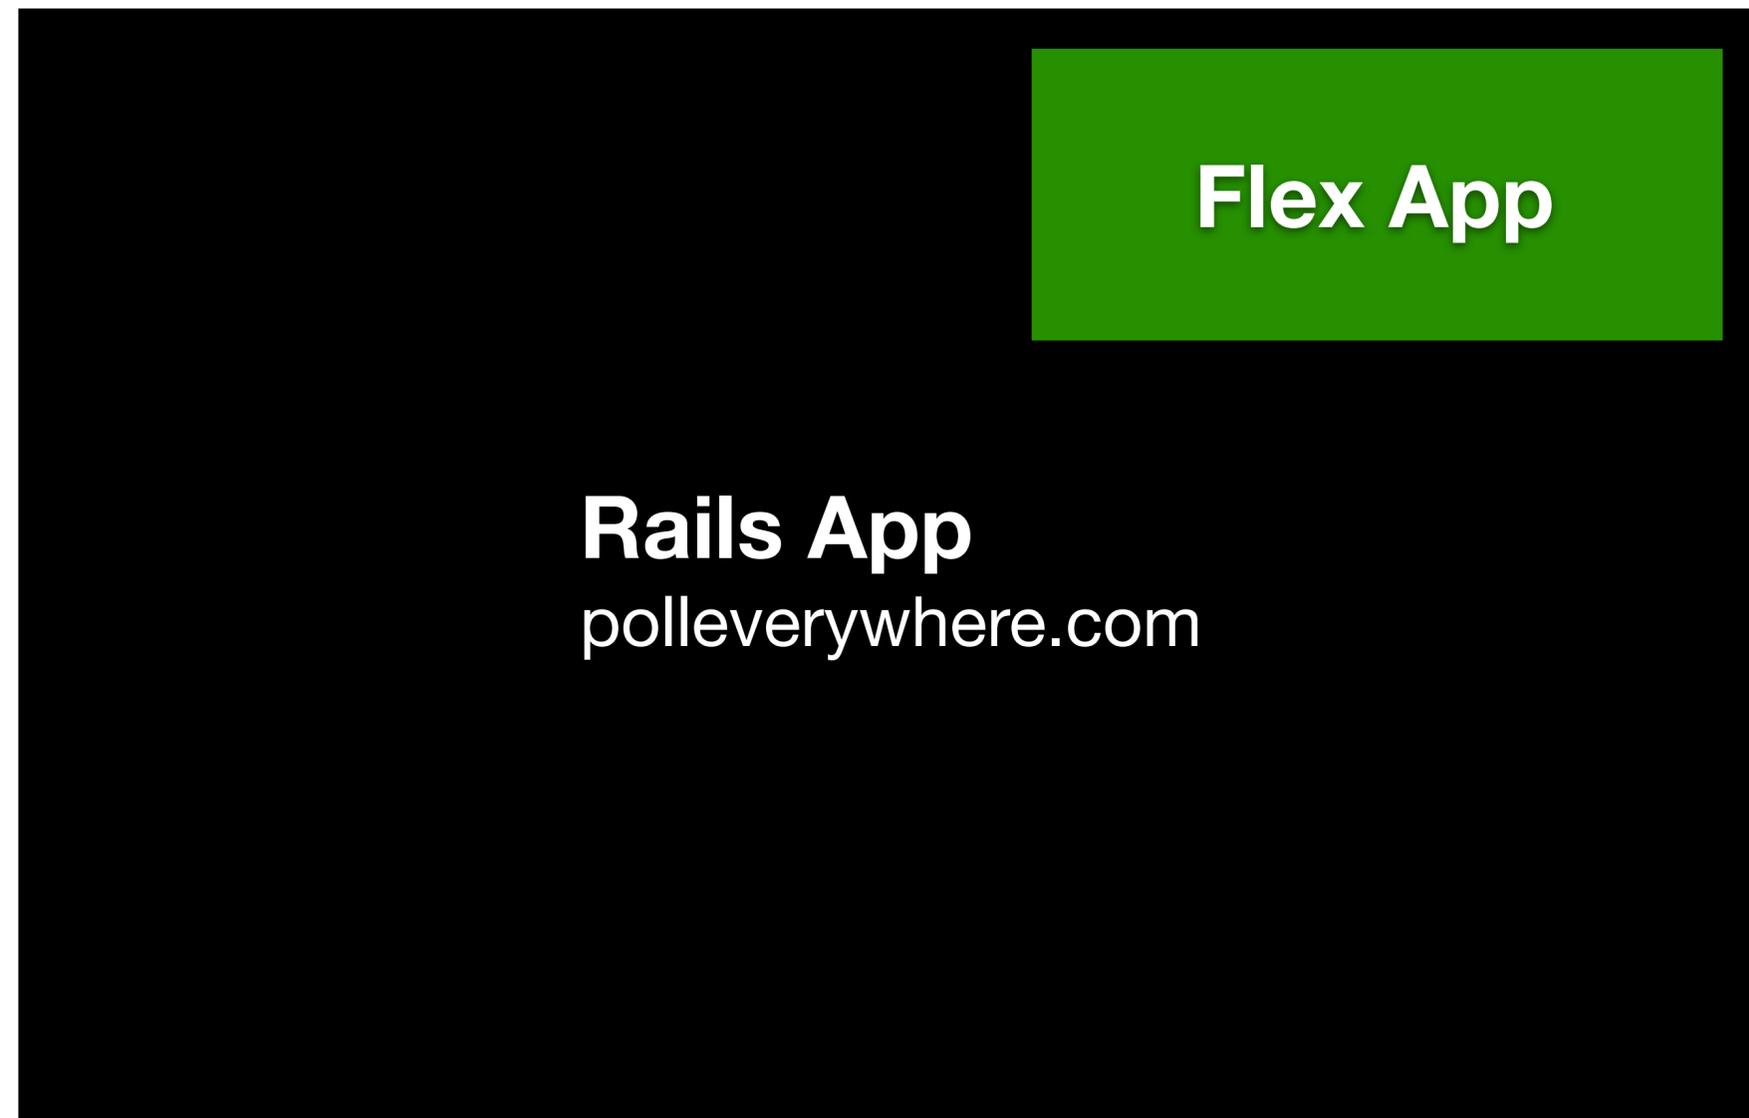

Say hello to the polleverywhere.com **Rails**
app circa 2008

Rails App
polleverywhere.com

A **Flex app** was created **within the rails project** for PowerPoint visualizations

We broke the Flex app into its own project so that our Flex contractor could **deploy independently from the Rails app** team

Flex App

XML API

Rails App
polleverywhere.com

Smart phones started taking off, so we built **.mobi extension views in Rails with jQuery mobile**

Flex App

XML API

jQm/.mobi

Rails App

polleverywhere.com

jQuery mobile and **.mobi** **was a big disaster**. Framework got us 80% there, the other 20% was painful and error prone

Flex App

XML API

jQm/.mobi

Rails App

polleverywhere.com

Our team made the decision to **hand pick libraries** to have **exactly what we need, when we need it.**

Framework agnostic Middleman would be there to manage all of the assets

Our first **single page HTML application**
was built in Middleman at PollEv.com

Flex App

Mobile App

XML API

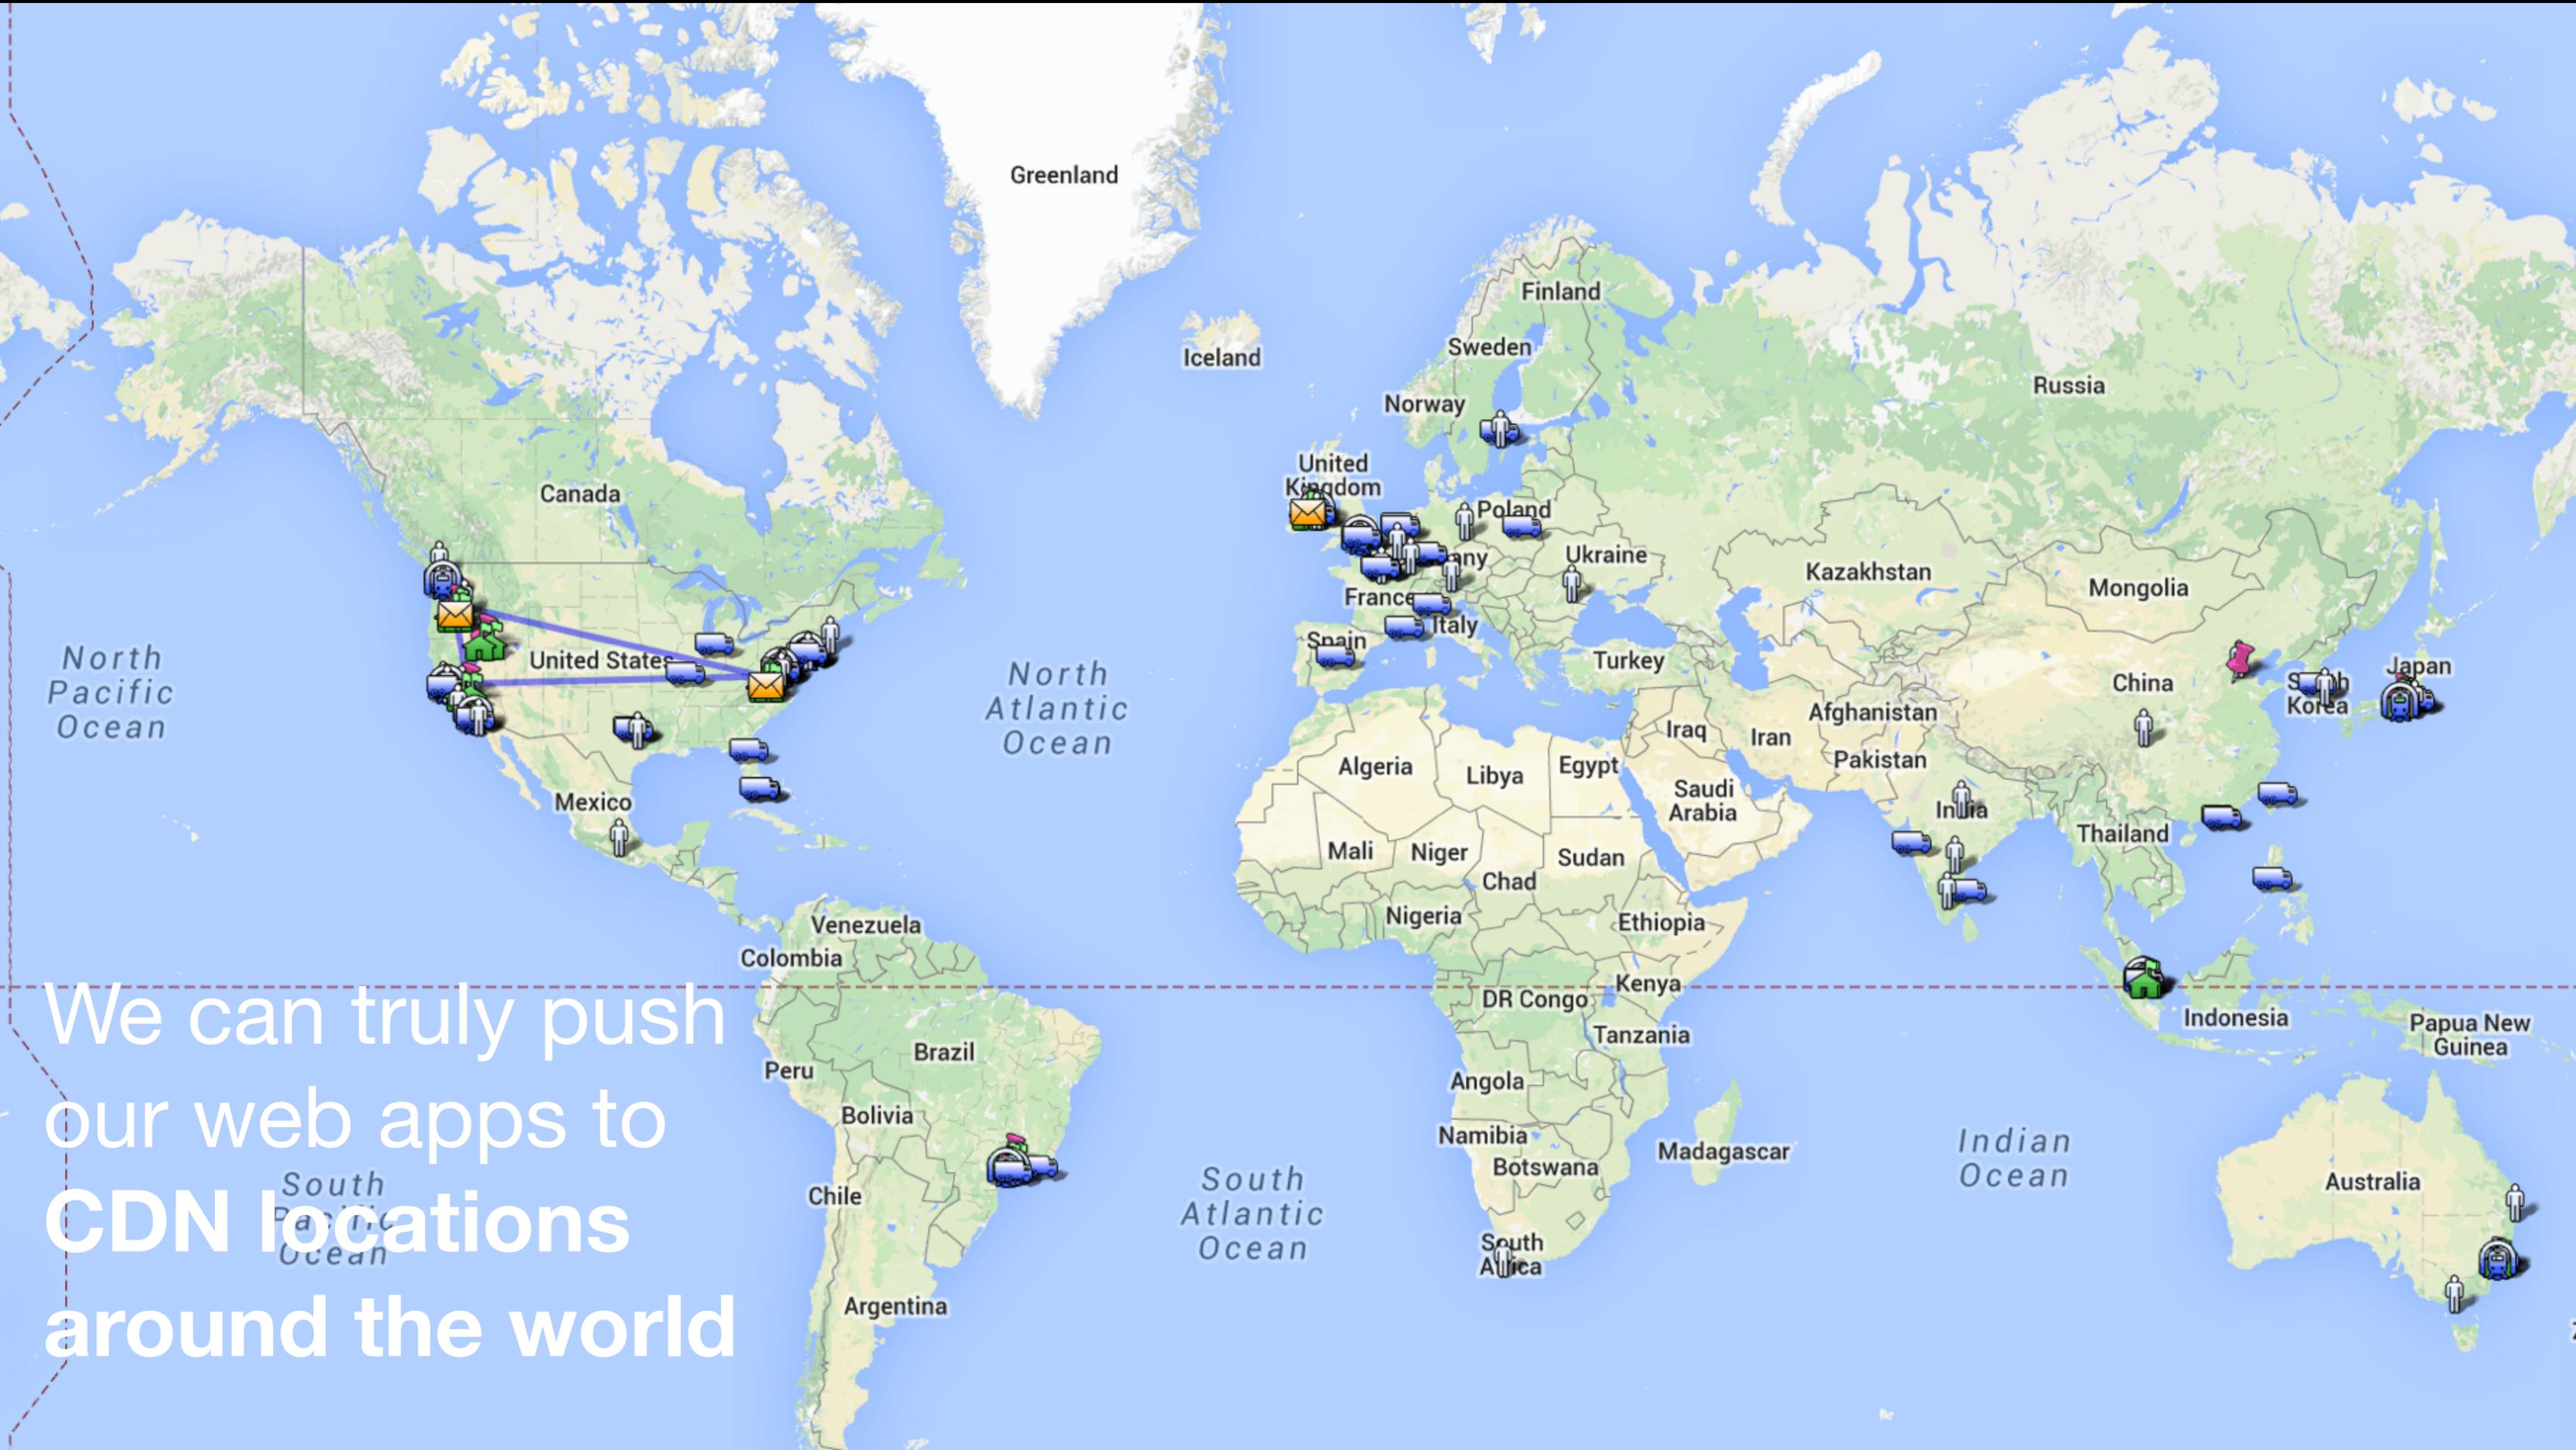

JSON API

Rails App

polleverywhere.com

COORS

Cross-origin resource sharing

We can truly push
our web apps to
CDN locations
around the world

... or to **floppy disks** and
Cordova apps

Flash was on its deathbed, so we set out to replace the Flex app with **another single page Middleman app**

Visualization App

Mobile Web App

JSON API

Rails App

polleverywhere.com

To reduce latency, a **Stream API** was deployed to production

Visualization App

Mobile Web App

Stream API

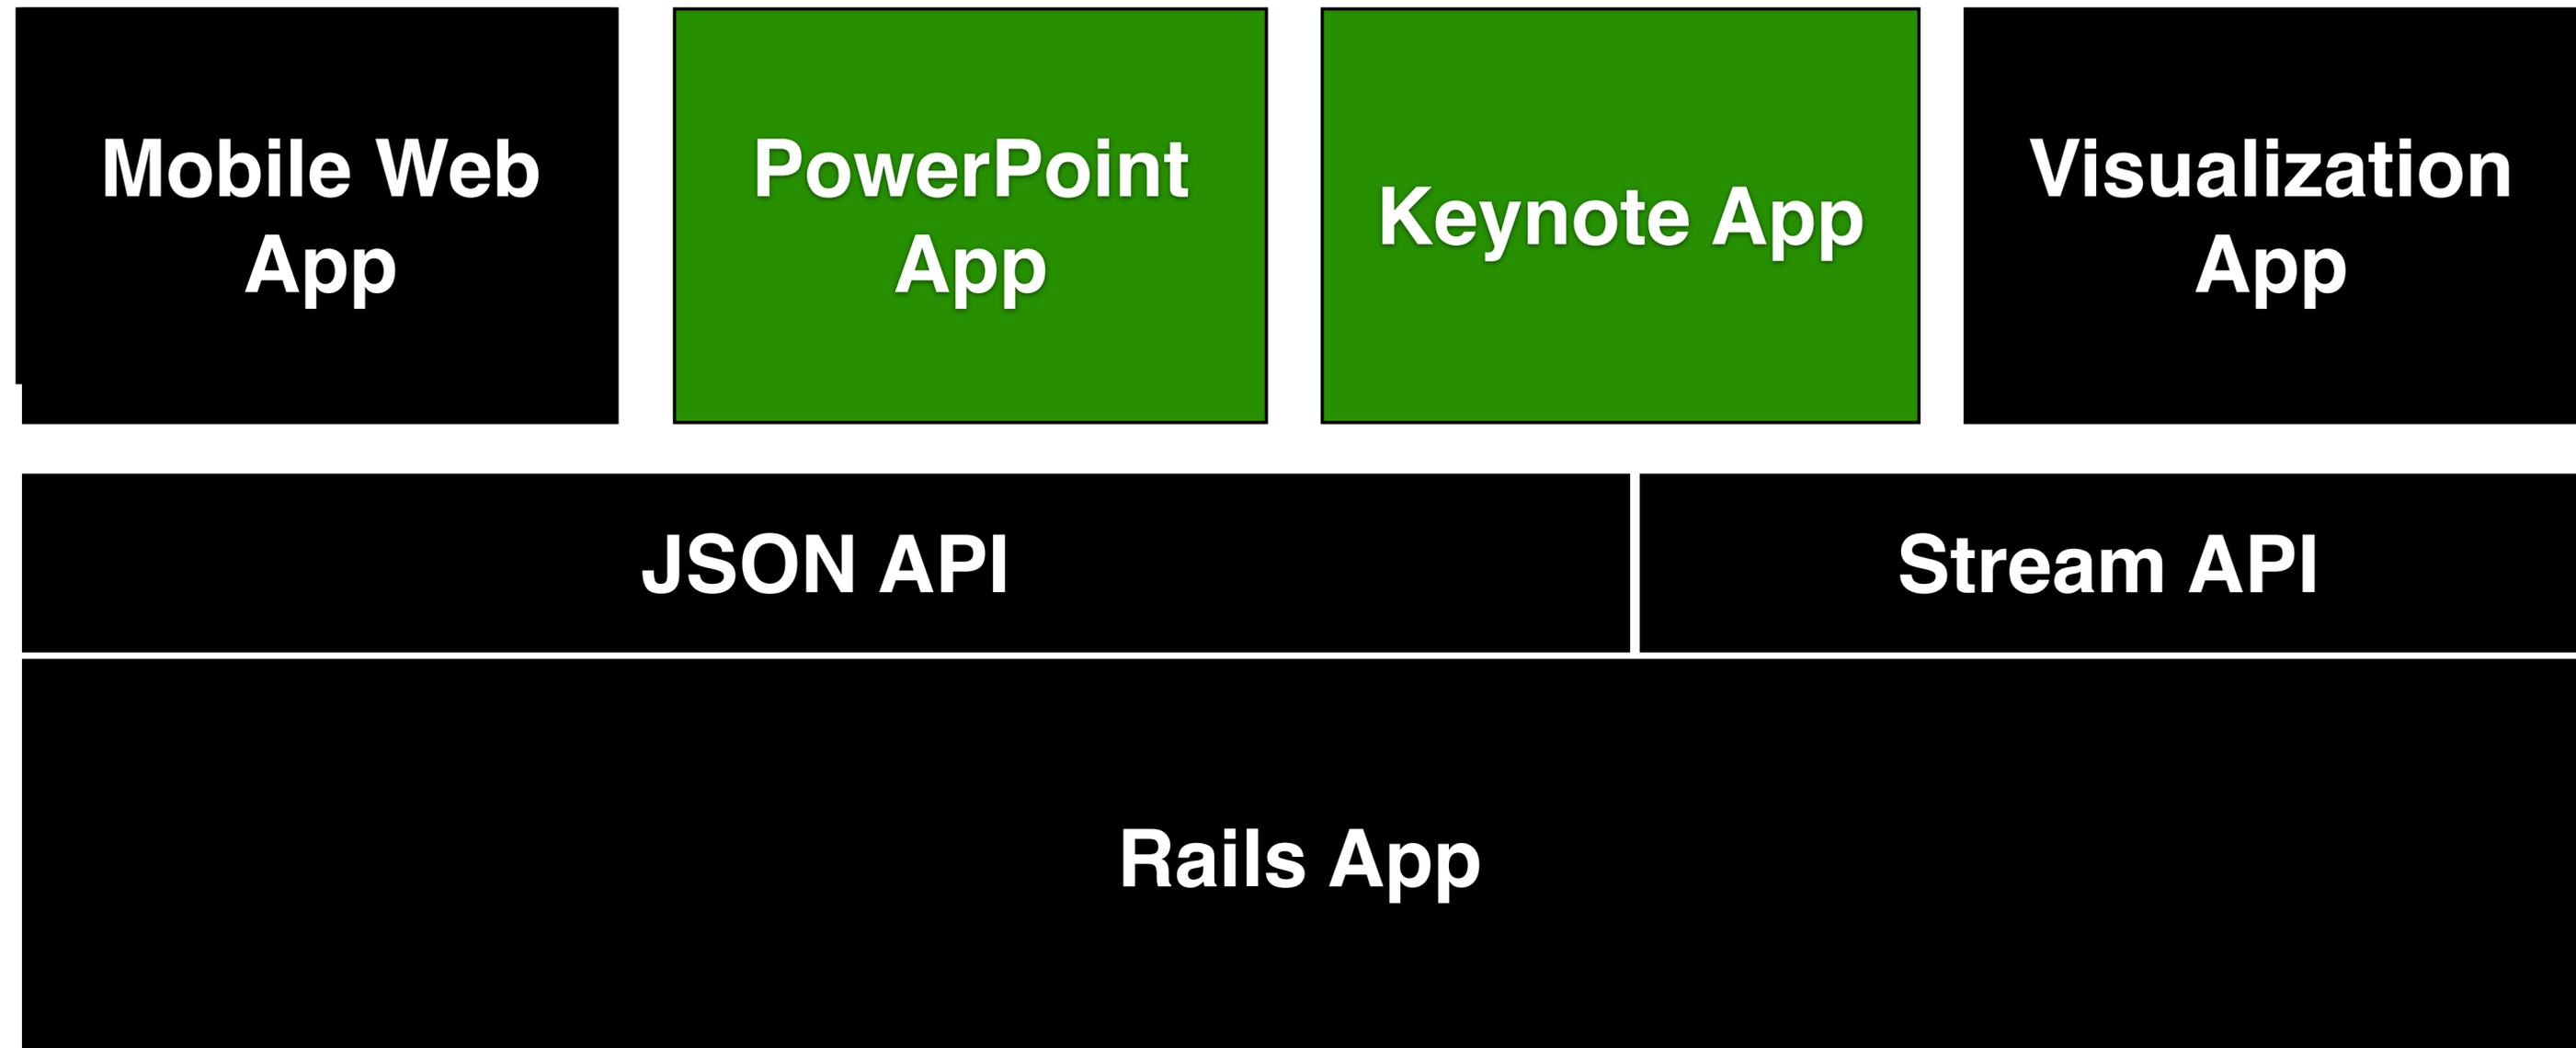

JSON API

Rails App

polleverywhere.com

Stream API was isolated to its own host and server fleet for isolation and stability purposes. **Client-side SOA** allowed us to start using the Stream API, stabilize in production, gain confidence, and ensure a smooth rollout.

More apps emerge on the scene, **how do we keep it all DRY?**

Extract common Coffeescript, Sass, assets into a **sprockets asset gem**

Mobile Web
App

PowerPoint
App

Keynote App

Visualization
App

Sprockets Asset Gem

JSON API

Stream API

Rails App

Create a **sprockets asset gem** to share assets between apps

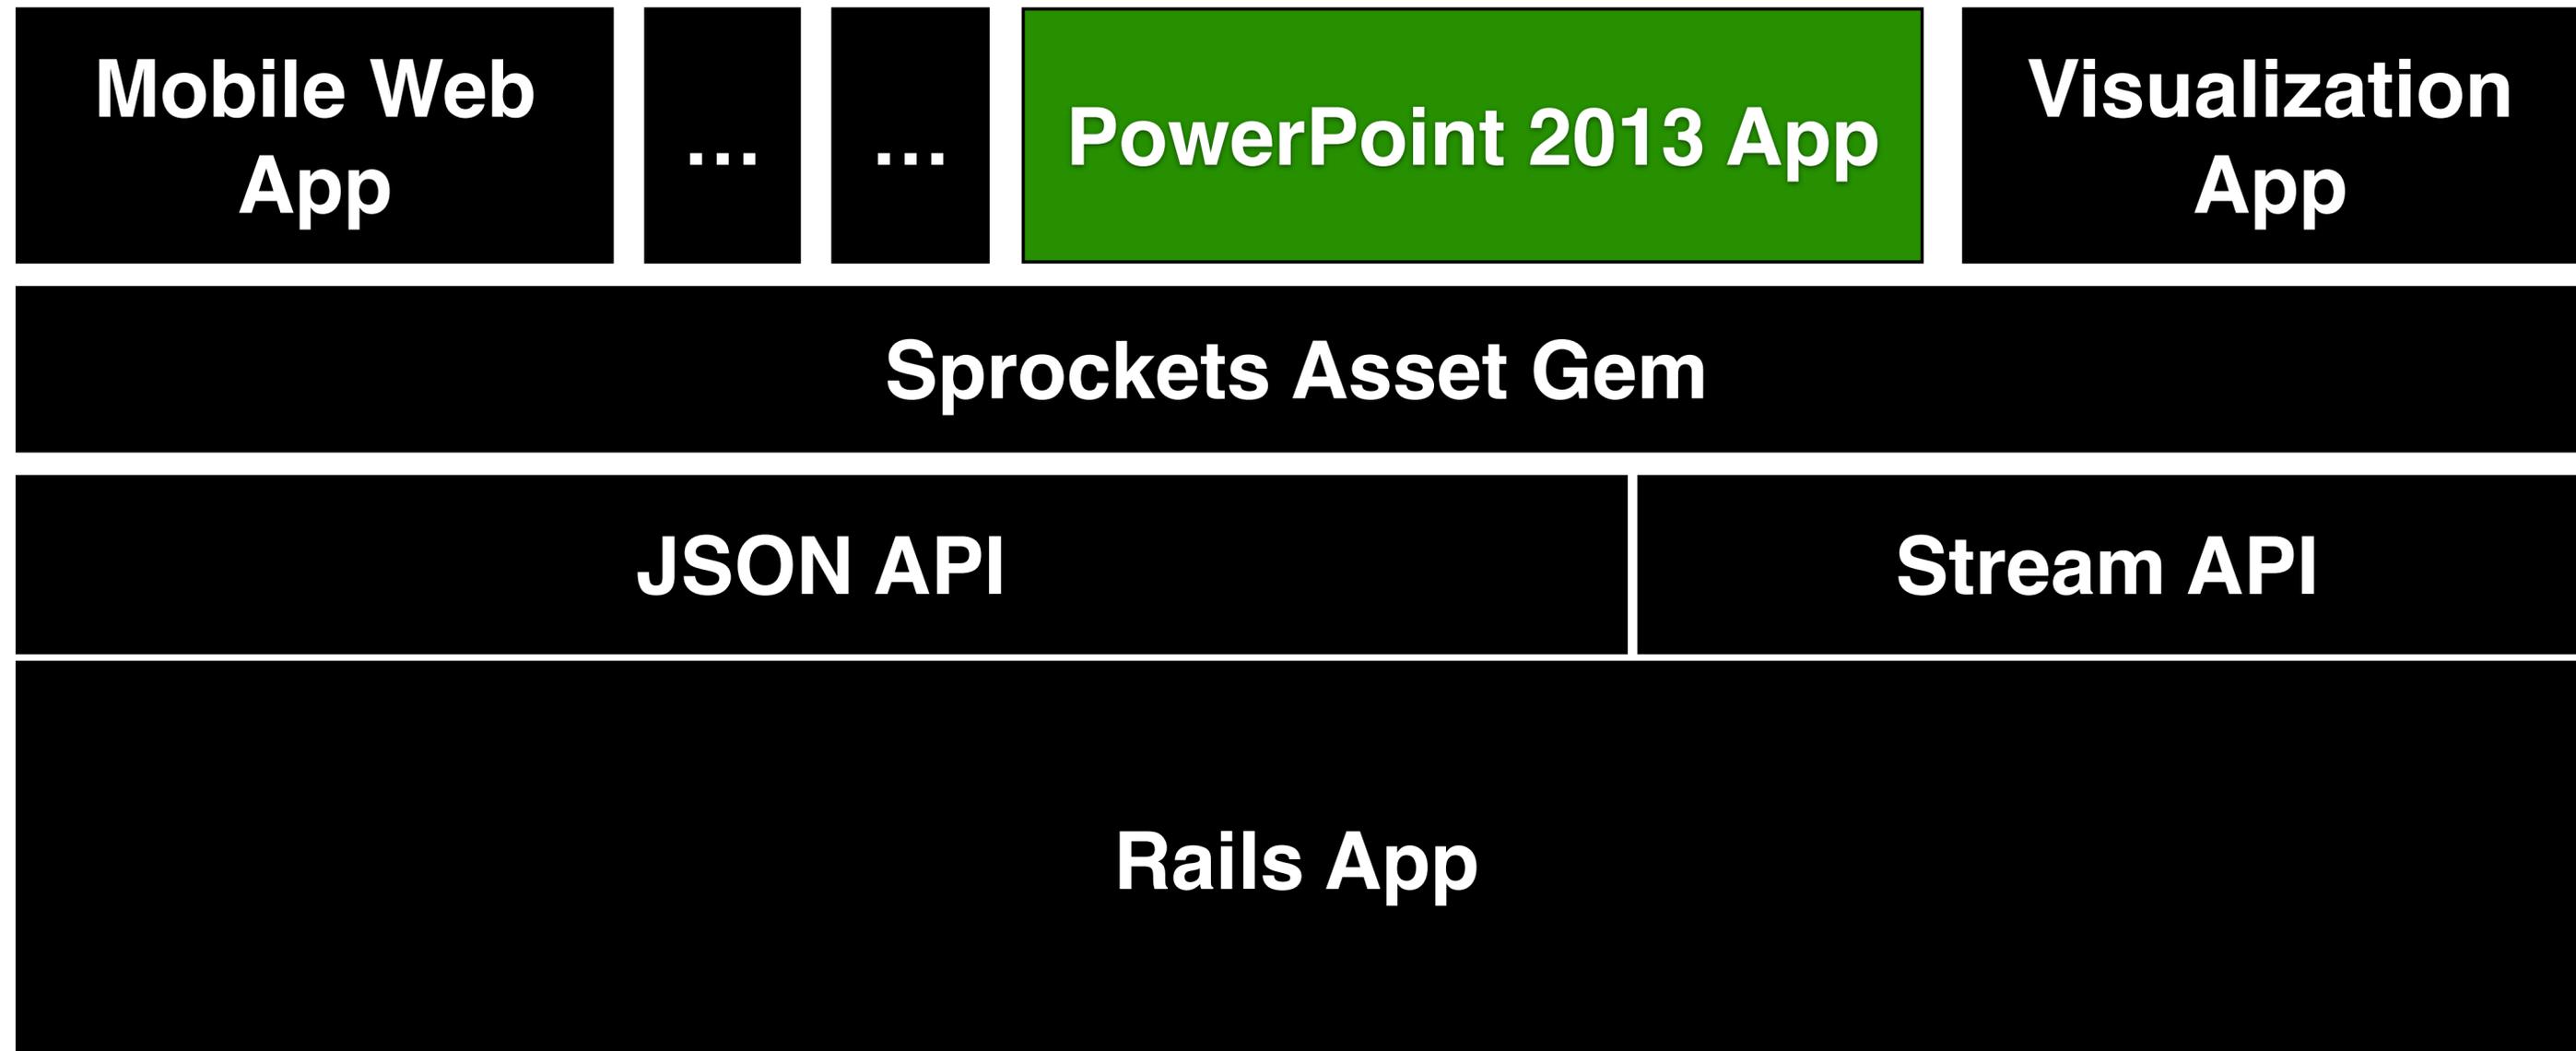

```
# The ./lib/pollev_assets.rb file
require 'pollev_assets/version'

if defined? Sprockets
  Sprockets.env.append_path 'lib/assets/javascripts'
  Sprockets.env.append_path 'lib/assets/stylesheets'
  Sprockets.env.append_path 'vendor/assets/javascripts'
end
```

```
# App ./Gemfile
if path = ENV['ASSETS_GEM_PATH']
  gem "pollev_assets", path: path
else
  gem "pollev_assets", branch: 'new-feature'
end
```

Manage asset gem dependencies
and branches **with Bundler**

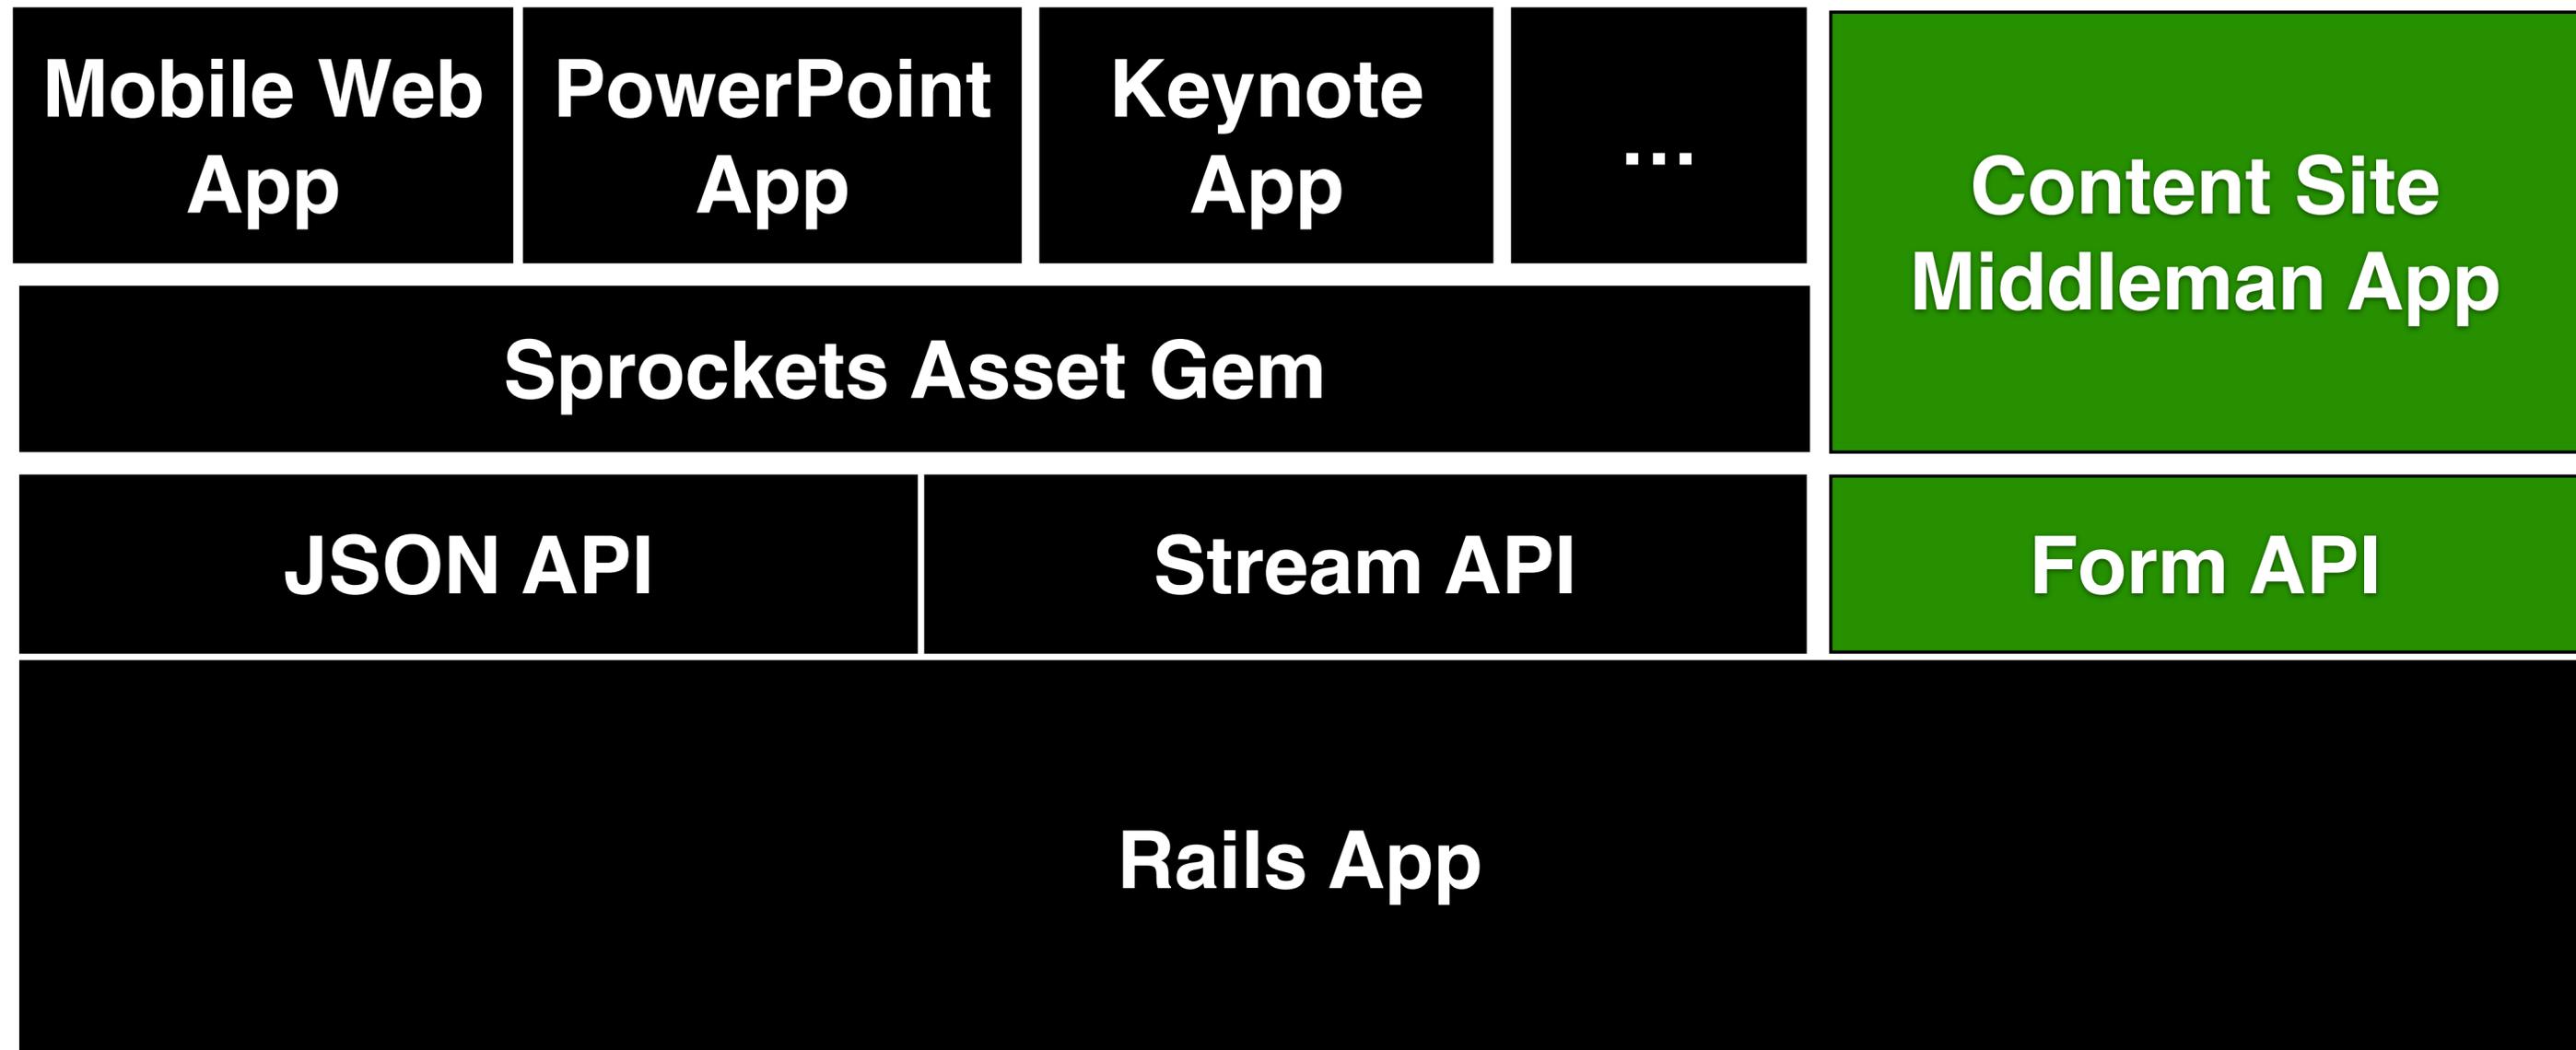

We **reused** mobile app **assets** to build
PowerPoint 2013 app in 2 weeks

No out-of-box solution exist for
organizing JS MVC apps in
Middleman

What about **static websites**?

Extract content from Rails app so marketing team can move faster

Some **dynamic components** are still **required**

Render login state via JavaScript snippet

Integration between Middleman content site and Rails app should have well defined and tested integration points

Stripe.js, GA, Optimizely are all dynamic tools that can be integrated into a static website

Why bother with a static content website?

Don't let "TechCrunched" or HN'ed or whatever the cool kids call it these days bring down your site

Introduce completely different workflows into content production without a heavy CMS

Easier deployments, can you upload a file?

...a few things I didn't cover

How to not use hash bang URLs with pushState

12-factor middleman apps

Validate test, staging, and any other environment with acceptance tests

The state of exception monitoring in production environments

Building an API side-by-side with client code deployments
